Q2. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

```
#Remember to add a comma, or it will return a 1 dimension vector
#Better to write out a vector first, see `to.keep`
to.keep <- rowSums(countData) != 0
countData = countData[to.keep, ]

```
pathview(gene.data=foldchanges, pathway.id="hsa04110", kegg.native=FALSE)

'select()' returned 1:1 mapping between keys and columns

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

Most significant "Entities p-values": Endosomal/Vacuolar pathway

They kind of match, but not exactly. One of the top 5 down-regulated genes is nucleo-cytoplasmic transport which is related but others are not so related.

Differences cause by analyzing against different databases.(?)
